Making a BRAKE for international collaboration

Center Director and Beth Slater have found a way to encourage researchers to engage in international research. It's called the Brain Research and Administration Knowledge Exchange (BRAKE) initiative.

The initiative was created to encourage researchers to engage in international research. "The BRAKE initiative was created to encourage researchers to engage in international research. It's a way to bring in researchers from other countries to collaborate with our own," said Clark. "We are now starting to see the reward, in that people are more willing to engage in international research." The initiative is run by the University of Maryland at College Park, and is supported by the National Institutes of Health (NIH). It is a way for researchers to connect with their counterparts in other countries, and to learn about the research being done in those countries.

The initiative has been a success, and has already resulted in several successful collaborations. "We have seen a lot of interest in the initiative, and have already seen some successful collaborations," said Clark. "We have seen a lot of interest in the initiative, and have already seen some successful collaborations." The initiative has been a way for researchers to connect with their counterparts in other countries, and to learn about the research being done in those countries.
